ON-GOING RESEARCH

Structured matrices, arising from the abstraction of real world physical systems modelled by discretized partial differential equations, are prevalent in fluid dynamics, computational finance, and image processing. Current ways to store and solve problems using these matrices can be slow. My current research is interested in expointing hidden structure so that we can construct robust and novel approximations of the Hessian to be used in nonlinear preconditioning for scientific and machine learning problems. More technical research topics include: iterative methods, multilinear algebra, tensor-based decomposition, fractional and nonlinear PDEs, and preconditioning.
