ON-GOING RESEARCH	<p>Structured matrices, arising from the abstraction of real world physical systems modelled by discretized fractional partial differential equations, are prevalent in fluid dynamics, computational finance, and image processing. Current ways to store and solve problems using these matrices can be slow. My current research is interested in finding ways that exploit hidden structure so that we can minimize storage and computational time. More technical research topics include: multilinear algebra, tensor-based decomposition, fractional PDEs, and preconditioning.</p>
